Layout Paper

Layout Paper is a lightweight, semi-transparent and smooth paper. Its most common use for sketching and planning initial ideas / layouts as its smoothness makes it easier to draw sharp and precise sketches. However as the paper is so thin it is not appropriate to use markers on it as it will bleed through.

Layout paper is made by pulping wood and other fibres into a slurry (a somewhat liquid mixture). It is then dewatered, pressed and then dried. Next the pulp is bleached so it turns white and then pressed and dried again. It is semi-transparent as the paper is heavily refined

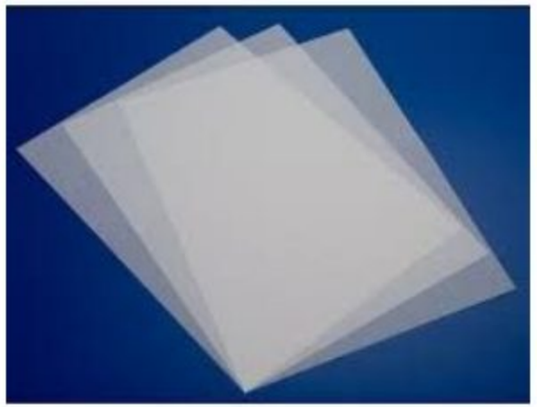

Tracing Paper

Tracing Paper is a translucent paper that is used by designers to copy or transfer an image / design. This paper is used for tracing as it is translucent enough to let light go through, allowing for the user to easily see the image underneath and copy it.

Tracing Paper is made by treating the paper with either acid or oil, which makes it strong and translucent. As well as being used for tracing it is also used to draw on to layer pieces of art.

Copier Paper

Copier Paper is a paper designed to be used in printers, photocopiers and laser printers. The paper itself is designed to be opaque so that it is possible to be write on both sides. The fact that it is opaque means that it is perfect to print pictures on as well as they will not show on the other side of the paper.

Copier paper has the some process of production as layout paper, however it is not nearly as refined as layout paper making it more opaque

Cartridge Paper

Cartridge Paper is a strong, thick drawing paper traditionally used to make paper cartridges for firearms. In designing it is used for drawing and sketching due to its good durability making it suitable ink work, pencil work and watercolour as the paper does not warp when it is wet.

The process of production of cartridge paper is similar to copier paper however it is not finished off with a smooth surface like all the other papers, the texture of the paper being the reason of why the paper can hold pigments so well
