Permanently Joining Materials

Aim:

Investigate methods which use ***'heat'*** to ***permanently*** join materials.

Research

Task:

1. Create a Google Slides document.
2. Research the following joining processes:
   - *Soldering (Hard and Soft)*
   - *Brazing*
   - *Gas Welding - Oxy-acetylene welding*
   - *Electric Arc Welding*
   - *Metal Inert Gas (MIG) Welding*
   - *Tungsten Inert Gas (TIG) Welding*
   - *Resistance (Spot) Welding*
3. Produce ***one*** slide per method including 'diagrams' which explains the joining processes.
4. Your slides should have headings and subheadings. Including the following information:
   - *Explain the joining process - How would you join material using this method? Are there special joints which can be produced using this method?*
   - *What equipment is required?*
   - *What materials can be joined using this method - applications?*
   - *What are the advantages / disadvantages of using this method?*
   - *What health and safety criteria need to be met?*
5. Attach your work to Google Classroom

Soldering (Hard and Soft):

Brazing:

Gas Welding - Oxy-acetylene welding:

Electric Arc Welding:

Metal Inert Gas (MIG) Welding:

Tungsten Inert Gas (TIG) Welding:

Resistance (Spot) Welding:
